

Here are some things to look at as you prepare for the final exam. The questions on this review sheet cover the material since the last exam, and a review of logarithms. The final exam is cumulative, so remember to look at Review for Exam 1 and Review for Exam 2 as you study. Also, remember to look at quizzes and homework problems, as well as the old exams. The actual exam will consist of a large number of true/false and multiple choice problems, but the problems below will help you understand the concepts covered on the exam. Try to do as many of these as you can without looking in your notes or book for guidance.

The final exam will be on Tuesday, 13 December from 11 am - 1 pm.

1. Simplify the following expressions:

(a) $\ln e^3$

(b) $10^{\log 7.4}$

(c) $\log_8 16$

(d) $\log_{25} 5$

2. Write each expression as a single logarithm:

(a) $\log 4k + \log 5k^3$

(b) $4 \ln x - 2(\ln x^3 + 4 \ln x)$

3. Solve each equation:

(a) $\ln(m + 3) - \ln m = \ln 2$

(b) $2 \ln(y + 1) = \ln(y^2 - 1) + \ln 5$

(c) $\log(m + 2) = 1$

(d) $\log_2(3k - 2) = 4$

(e) $\log_5 \left(\frac{5z}{z - 2} \right) = 2$

(f) $\log_2 r + \log_2(r - 2) = 3$

(g) $2^{3x} = \frac{1}{8}$

(h) $\left(\frac{9}{16} \right)^x = \frac{3}{4}$

(i) $9^{2y-1} = 27^y$

(j) $8^p = 19$

(k) $6^{2-m} = 2^{3m+1}$

$$(1) 2 \cdot 15^{-k} = 18$$

4. Know the following formulas. They will **NOT** be provided on the exam.

	Interest	Future Value	Present Value
Simple Interest	$I = Prt$	$A = P(1 + rt)$	$P = \frac{A}{1 + rt}$
Compound Interest	$I = A - P$	$A = P(1 + i)^n$	$P = \frac{A}{(1 + i)^n}$
Continuous Interest	$I = A - P$	$A = Pe^{rt}$	$P = \frac{A}{e^{rt}}$
Ordinary Annuity		$S = R \left(\frac{(1 + i)^n - 1}{i} \right)$	$P = R \left(\frac{1 - (1 + i)^{-n}}{i} \right)$

5. Find the simple interest for an investment of \$4902 at 9/5% for 11 months.
6. Find the future value of an investment of \$3478 at 7.4% for 88 days (assume 365 days in a year).
7. Find the present value of the future amount \$459.57 if the money is invested at a simple interest rate of 8.5% for 7 months.
8. Find the amount of money in an account in which the initial deposit is \$2800 earning 6% interest compounded annually after 10 years.
9. Find the present value of the future amount \$42,000 if the money is deposited in an account paying 12% compounded monthly for 7 years.
10. Find the future value of the annuity where \$1288 is deposited at the end of each year for 14 years, where the money earns 8% compounded annually.
11. Find the future value of the annuity where \$233 is deposited at the end of each month for 4 years and the money earns 12% compounded monthly.
12. Find the present value of the ordinary annuity where payments of \$850 are made annually for 4 years at 5% compounded annually.
13. Find the present value of the ordinary annuity where payments of \$4210 are made semiannually for 8 years at 8.6% compounded semiannually.
14. Find the amount of the payment necessary to amortize a loan of \$32,000 at 9.4% compounded quarterly to be repaid in 10 quarterly payments.

15. Find the monthly house payment for a mortgage of \$56,890 at 10.74% for 25 years.
16. A firm of attorneys deposits \$15,000 of profit-sharing money in an account at 6% compounded semiannually for 7.5 years. Find the amount of interest earned.
17. According to a financial web site, Bank A paid 6.9% interest compounded quarterly on a one year CD, and Bank B paid 6.88% compounded monthly. What are the effective rates for the two CDs and which bank pays a higher effective rate?
18. Each year a firm must set aside enough funds to provide employee retirement benefits of \$52,000 in 20 years. If the firm can invest money at 7.5% compounded monthly, what amount must be invested at the end of each month for this purpose?
19. In 3 years, Mary must pay a pledge of \$7500 to her favorite charity. What lump sum can she deposit today, at 10% compounded semiannually, so that she will have enough to pay the pledge?
20. Solve the following systems of equations:
 - (a) $-5x - 3y = 4$
 $2x + y = -3$
 - (b) $3x + y - z = 13$
 $x + 2z = 9$
 $-3x - y + 2z = 9$
21. Gretchen Schmidt plans to buy shares of two stocks. One costs \$32 per share and pays dividends of \$1.20 per share. The other costs \$23 per share and pays dividends of \$1.40 per share. She has \$10,100 to spend and wants to earn dividends of \$540. How many shares of each stock should she buy?
22. Joyce Pluth has money in two investment funds. Last year the first fund paid a dividend of 8% and the second dividend of 2% and Joyce received a total of \$780. This year the first fund paid a 10% dividend and the second only 1% and Joyce received \$810. How much does she have invested in each fund?
23. Shirley Cicero has \$16,000 invested in Boeing and GE stock. The Boeing stock currently sells for \$30 per share and the GE stock for \$70 per share. If GE stock triples its value and the Boeing stock goes up 50%, her stock will be worth \$34,500. How many shares of each stock does she own?
24. Pretzels cost \$3 per pound, dried fruit \$4 per pound and nuts \$8 per pound. how many pounds of each should be used to produce 140 pounds of trail mix costed \$6 per pound in which there are twice as many pretzels (by weight) as dried fruit?
25. You are given \$144 in one, five, and ten dollar bills. There are two more ten dollar bills than five dollar bills. If there are a total of 35 bills, how many bills of each type are there?
26. Use matrices and your calculator to solve the following systems:
 - (a) $4x - y - 2z = 4$
 $x - y - \frac{1}{2}z = 1$
 $2x - y - z = 8$

$$\begin{aligned} \text{(b)} \quad x - z &= -3 \\ y + z &= 6 \\ 2x - 3z &= -9 \end{aligned}$$

$$\begin{aligned} \text{(c)} \quad x - 2y + 3z &= 4 \\ 2x + y - 4z &= 3 \\ -3x + 4y - z &= -2 \end{aligned}$$

27. In deciding whether to set up a new manufacturing plant, company analysts have decided that a linear function is a reasonable estimation for the total cost $C(x)$ in dollars to produce x items. They estimate the cost to produce 10,000 items as \$547,500 and the cost to produce 50,000 items as \$737,500.
- (a) Find a formula for $C(x)$.
 - (b) Find the total cost to produce 100,000 items.
 - (c) Find the marginal cost of the items produced in this plant.
28. Colleen Davis owns a factory that manufactures souvenir key chains. her weekly profit (in hundred of dollars) is given by $P(x) = -2x^2 + 60x - 120$, where x is the number of cases of key chains sold.
- (a) What is the largest number of cases she can sell and still make a profit?
 - (b) How many cases should she make and sell in order to maximize her profits?
 - (c) What is the maximum profit she could earn?
29. The profit (in millions of dollars) from the sale of x million units of Blue Glue is given by $p = 0.7x - 25.5$. The cost is given by $c = 0.9x + 25.5$.
- (a) Find the revenue equation.
 - (b) What is the revenue from selling 10 million units?
 - (c) What is the break even point?
