**The Relationship Between the TriPM and Self-
Report and Interview-Rated Measures of Section
III Antisocial Personality Disorder Traits**

Research has examined the convergence of the triarchic traits with the AMPD's Antisocial Personality Disorder (ASPD) and Psychopathy Specifier (PS) facets using largely self-report measures. The purpose of this thesis was to examine the relationship between the TriPM and self-report and interview-rated Criterion A and Criterion B ASPD and PS facets in a multimethod approach. A multimethod research design ensures measures of personality are psychometrically sound and provide more accurate and comprehensive data. The results of this study expand upon the literature examining how these traits relate to personality functioning, which can provide researchers and clinicians with a more comprehensive understanding of how these traits are perceived and relate to functioning by both the individual and the interviewer.
