An Examination of the US Spanish MMPI-3: Reliability, Validity, and Comparability to the English Form

The US Spanish Minnesota Multiphasic Personality Inventory-3 (MMPI-3) is a recently released translated version of the English MMPI-3. The current study aimed to examine the reliability, validity, and comparability of the Spanish version to the English form. Further, we examined external validity with measures of general psychopathology and personality pathology. Overall, the instrument was found to be valid and reliable with minimal differences to the English version. There were some noted low associations, particularly within the Psychoticism domain and facets associated with externalizing behaviors, due to range restriction. Implications, limitations, and future directions will be discussed.
