Juvenile Competency Restoration in Texas: Factors Associated with Remediation in Inpatient Settings

When juveniles are found unfit to proceed in juvenile court, they can be remanded to a juvenile competency restoration program. There is little research in the field regarding factors which may influence the likelihood of successful remediation, including demographic and clinical variables or components of treatment. The current study utilized state hospital records to examine juvenile competency restoration rates in Texas. Results provide insight into significant associations, which have implications for the treatment of youth involved in the juvenile justice system.
