Investigating Trait Profiles of Narcissism Using the PID-5

This study aims to examine the utility of the Alternative Model of Personality Disorders (AMPD), using its corresponding measure the Personality Inventory for DSM-5 (PID-5), in assessing various conceptualizations of narcissism by using latent class analysis to investigate what trait profiles of narcissism emerge. The current study aims to provide an opportunity for unification of the many conceptualizations of narcissism and also clarify the operationalization and measurement of narcissism more broadly.
